

D:_KAZE_Gamera_TAR_revision14>Yoshi.exe -v " *.*.?"
Yoshi(Filelist Creator), revision 6+, written by Svalqatchx,
in fact based on SWEEP.C from 'Open Watcom Project', thanks-thanks.

Note1: So far, it works for current directory only.
Note2: Default method is depth-first traversal;
may use pipe 'Yoshi|sort' for breadth-first-like traversal results.
Note3: Make notice that '*.*(extensionfull only)' is not equal to '*'(all);
one disadvantage is an inability to list only extensionless filenames.
Note4: Search is case-insensitive as-must.
Note5: This revision allows multiple '*', and meaning of masks is:
'?' - any character AND NOT EMPTY(default, for OR EMPTY see option -e);
'*' - any character(s) or empty.
Note6: What is a .LBL(LineByLine) file?
it is a bunch of GRAMMATICAL lines not mere LF or CRLF lines;
it contains not symbols under 32(except CR and LF) and above 127;
it contains not space symbol sequences.
Note7: Since r.6+ size of files bigger than 4GB is correctly reported.

Usage:

Yoshi [option(s)] [filename(s)]
option(s):
-v i.e. verbose mode; output goes to console;
-f i.e. fullpath mode for output;
-e i.e. treat '?' as any character OR EMPTY;
-t i.e. touch all encountered files;
-2 i.e. convert all encountered .TXT files to .LBL files;
-o<filename> i.e. output goes to file(in append mode).
filename(s):
wildcards '*' and wildcards '?' are allowed i.e. "str*.c??";
default filename is '*'; DO NOT FORGET TO PUT
filename(s) WITH WILDCARD(S) INTO QUOTE MARKS!

Examples:

Yoshi -v -f -oCaterpillar_NON.lst " *.lbl" " *.txt" " *.htm" " *.html"
Yoshi -f -oMyEbooks.txt " *wiley*essential*.pdf" " *russian*.htm"

.\Linereporter.c
