Summary:

To count in the American system and the Traditional British system you need the following:

zero
one two three four five six seven eight nine
ten eleven twelve thirteen fourteen fifteen sixteen seventeen eighteen nineteen
twenty thirty forty fifty sixty seventy eighty ninety hundred thousand
mi bi tri quadri quinti sexti septi octi noni
un do tre quattuor quin sex septen octo novem
dec vigin trigin quadragin quinquagin sexagin septuagin octogin nonagin
cen ducen trecen quadringen quingen sescen septingen octingen nongen
millia

With these endings:

illion or tillion

The term *Latin power* refers to the exponent of 1000. So 1000^4 has a *Latin power* of 4. The *prefix cardinal* is one less than the *Latin power*, so 1000^4 has a *prefix cardinal* of 3.

At the *Latin power* of 1,000,000 we have:

one nongen-novem-nonagin-millia-nongen-novem-nonagin-tillion

However at the *Latin power* of 1,000,001, we run out of prefixes! It is at this point that we introduce our final rule: the repeated prefix.

In the past, it was common to refer to million as "thousand thousand". Thus a thousand millia becomes "millia millia". And a million millia becomes "millia millia millia".

$1000^1,001$	one millia-tillion
$1000^1,000,001$	one millia-millia-tillion
$1000^1,000,000,001$	one millia-millia-millia-tillion
$1000^1,000,000,000,001$	one millia-millia-millia-millia-tillion

So with this final rule, there is no limit to how high you can count!

With following, *Kaze* can count to:

ten tre-millia-trecen-do-trigin-tillion i.e. $10, \{3332 \text{ more } 000\text{'s}\}, 000$

An example, now lets try naming the number:

123,456,789,246,801,357

Using the system described thus far, we are now able to convert the number into multiples of Latin powers:

123 * 1000⁵ (*Latin power 5 = prefix cardinal 4 = quadri-llion*)
456 * 1000⁴ (*Latin power 4 = prefix cardinal 3 = tri-llion*)
789 * 1000³ (*Latin power 3 = prefix cardinal 2 = bi-llion*)
246 * 1000² (*Latin power 2 = prefix cardinal 1 = mi-llion*)
801 * 1000¹ (thousand - special case)
357 * 1000⁰ (units - special case)

The American system would name that number:

one hundred twenty three quadrillion,
four hundred fifty six trillion,
seven hundred eighty nine billion,
two hundred forty six million,
eight hundred one thousand,
three hundred fifty seven

A final historical note:

When I was 6, as part of the test to enter the 1st grade I was asked:

How high can you count?

A bit of background:

Thanks to **Chet**, my brother, at age 3 I know the prefix rules up thru decillion. I had been attempting to memorize the numbers by brute force, and had made it up to 117. **Chet** came to my rescue by showing me the "trick" to counting. With the help of a table from the *Random House Dictionary* we had in our home, we learned the names of Latin powers up thru 11.

So with full confidence, at age 6, I answered:

*nine hundred ninety nine decillion,
nine hundred ninety nine nonillion,
nine hundred ninety nine octillion,
nine hundred ninety nine septillion,
nine hundred ninety nine sextillion,
nine hundred ninety nine quintillion,
nine hundred ninety nine quadrillion,
nine hundred ninety nine trillion,
nine hundred ninety nine billion,
nine hundred ninety nine million,
nine hundred ninety nine thousand,
nine hundred ninety nine*

The teacher was puzzled to say the least. To be sure I had not made a mistake, I went to the board and wrote out:

999,999,999,999,999,999,999,999,999,999,999

As I wrote it out, I named the groups "decillion, nonillion, ...". I explained that if she told me the next name (for the *Latin power* of 12, that is), I could add 3 more digits. And so I waited for my "teacher" to supply me with this word that would able me to count 3 orders of magnitude higher.

For some reason I could not understand, my teacher sat in silence for a while and then said:

"I don't believe you. Start counting."

I supposed I would have protested, counting was easy for me. Counting fast was something I had practiced. At age 6 I could count thru 100 in about 20 seconds. After rounding 500 I began to wonder if she understood what I was saying so I slowed down to show her I was really counting:

"... five hundred one, five hundred two, five hundred three ..."

and then switched back to my rapid counting pace. As I was counting she said:

"Sit in the corner. I'll get back to you later."

So I sat down in the corner, not sure if I was being punished or tested and continued counting. I figured that I should count as high and as fast as I could so I dropped my volume and went into high gear.

I used my left hand to keep track of the thousands digit and my right hand to keep track of the hundreds digit. (I had learned the trick of counting 1 to 10 on one hand from my brother **Chet**.) To save time I fully pronounced each multiple of a hundred between rapid counts of 1 to 99. When I rounded on 10000 I stick out my leg to record the 10000's digit.

Some 4 hours later (a huge span of time for a 6 year old) I was rounding 21600. I was beginning to get really tired and I had gradually slowed down but I was still counting at a fast pace. Well the teacher, who was testing other students, noticed that I was still in the corner counting. As she approached I slowed down and raised my volume so that she could hear me better:

*"... twenty one thousand, six hundred one,
twenty one thousand, six hundred two,
twenty one thousand, six hundred three, ..."*

She then said:

"Oh, OK. You can stop now."

I was relieved because I had used my 2nd leg to mark 20000 and was not sure what to do when I got to 30000. She returned to my test paper and along side the question "How high can you count?" she wrote:

over 100

I was mad. I was more than mad, I was insulted! I don't recall my reaction, but I'm sure it was not nice as I was punished for whatever I did in response.

At this point I lost my trust in grammar school teachers. I was sure that my teacher could not even say the name of 1 000 000 000 000 000, so why should I expect any teacher to know other facts? In the years to follow I made it a point of learning things on my own ... often at the expense of not paying attention in class. I'm sure I was a "difficult" child in the classroom. I'm not sure how things would have turned out if it were not for a 7th/8th grade history teacher named Mr. *Frank Tom* and 7th/8th science teacher named Mrs. *Arbigast*. As you can see from my bio, I changed. And to those teachers who helped: "Thanks!"

A HUGE lesson how NARROW are our boundaries these years, still denying-our-ignorance - what a nasty illness!

Thanks a lot Mr. **Landon Noll**.

On August 23rd, 2008, a UCLA computer in the GIMPS PrimeNet network discovered the 45th (biggest so far (2010-July)) known *Mersenne* prime, $2^{43,112,609}-1$, a mammoth 12,978,189 digit number!

In order to name $2^{43,112,609}-1$ I downloaded
